

## Homework 4

Due date: February 13th, 2025

Martin Coyne, Flora Dedvukaj, Anton Karabushin, Zhihan Lin, Joshua Morales

1. (a) We are given the points  $(0, 7), (2, 11), (3, 28), (4, 63)$ , so  $f(x_0) = 7, f(x_1) = 11, f(x_2) = 28, f(x_3) = 63$ .

The first order divided differences are as follows:

$$f[x_0, x_1] = \frac{7 - 11}{0 - 2} = 2$$

$$f[x_1, x_2] = \frac{28 - 11}{3 - 2} = 17$$

$$f[x_2, x_3] = \frac{63 - 28}{4 - 3} = 35$$

The second order differences are as follows:

$$f[x_0, x_1, x_2] = \frac{17 - 2}{3 - 0} = 5$$

$$f[x_1, x_2, x_3] = \frac{35 - 17}{4 - 2} = 9$$

And the third order difference is:

$$f[x_0, x_1, x_2, x_3] = \frac{9 - 5}{4 - 0} = 1$$

Using the Newton formula,

$$p_n(x) = f[x_0] + f[x_0, x_1](x - x_0) + f[x_0, x_1, x_2](x - x_0)(x - x_1) + \dots$$

We can write  $p_1$  as

$$p_1(x) = 7 + 2(x - 0) = 7 + 2x$$

$p_2$  as

$$p_2(x) = 7 + 2x + 5(x - 0)(x - 2) = 5x^2 - 8x + 7$$

and  $p_3$  as

$$p_3(x) = 5x^2 - 8x + 7 + 1(x - 0)(x - 2)(x - 3) = x^3 - 2x + 7$$

(b)

$$\begin{aligned} & \int_0^4 (x^3 - 2x + 7) dx \\ &= \int_0^4 x^3 dx - \int_0^4 2x dx + \int_0^4 7 dx \\ &= \left( \frac{x^4}{4} - x^2 + 7x \right) \Big|_0^4 \\ &= (64 - 16 + 28) - 0 = 76 \end{aligned}$$

2. (a) We know that the formula for the  $k^{th}$  divided difference is as follows:

$$f[x_0, x_1, \dots, x_k] = \frac{f[x_1, x_2, \dots, x_k] - f[x_0, x_1, \dots, x_{k-1}]}{x_k - x_0}$$

Given the table, we can calculate the first divided differences as

$$\begin{aligned} f[x_0, x_1] &= \frac{f(x_1) - f(x_0)}{x_1 - x_0} = \frac{4 - 1}{1 - (-2)} = \frac{3}{1} = 3 \\ f[x_1, x_2] &= \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{11 - 4}{0 - (-1)} = \frac{7}{1} = 7 \\ f[x_2, x_3] &= \frac{f(x_3) - f(x_2)}{x_3 - x_2} = \frac{16 - 11}{1 - 0} = \frac{5}{1} = 5 \\ f[x_3, x_4] &= \frac{f(x_4) - f(x_3)}{x_4 - x_3} = \frac{13 - 16}{2 - 1} = \frac{-3}{1} = -3 \\ f[x_4, x_5] &= \frac{f(x_5) - f(x_4)}{x_5 - x_4} = \frac{-4 - 13}{3 - 2} = \frac{-17}{1} = -17 \end{aligned}$$

The second divided differences are:

$$\begin{aligned} f[x_0, x_1, x_2] &= \frac{f[x_1, x_2] - f[x_0, x_1]}{x_2 - x_0} = \frac{7 - 3}{0 - (-2)} = \frac{4}{2} = 2 \\ f[x_1, x_2, x_3] &= \frac{f[x_2, x_3] - f[x_1, x_2]}{x_3 - x_1} = \frac{5 - 7}{1 - (-1)} = \frac{-2}{2} = -1 \\ f[x_2, x_3, x_4] &= \frac{f[x_3, x_4] - f[x_2, x_3]}{x_4 - x_2} = \frac{-3 - 5}{2 - 0} = \frac{-8}{2} = -4 \\ f[x_3, x_4, x_5] &= \frac{f[x_4, x_5] - f[x_3, x_4]}{x_5 - x_3} = \frac{-17 - (-3)}{3 - 1} = \frac{-14}{2} = -7 \end{aligned}$$

The third divided differences are

$$\begin{aligned} f[x_0, x_1, x_2, x_3] &= \frac{f[x_1, x_2, x_3] - f[x_0, x_1, x_2]}{x_3 - x_0} = \frac{1 - 2}{1 - (-2)} = \frac{-3}{3} = -1 \\ f[x_1, x_2, x_3, x_4] &= \frac{f[x_2, x_3, x_4] - f[x_1, x_2, x_3]}{x_4 - x_1} = \frac{-4 - (-1)}{2 - (-1)} = \frac{-3}{3} = -1 \\ f[x_2, x_3, x_4, x_5] &= \frac{f[x_3, x_4, x_5] - f[x_2, x_3, x_4]}{x_5 - x_2} = \frac{-7 - (-4)}{3 - 0} = \frac{-3}{3} = -1 \end{aligned}$$

The fourth divided differences are:

$$\begin{aligned} f[x_0, x_1, x_2, x_3, x_4] &= \frac{f[x_1, x_2, x_3, x_4] - f[x_0, x_1, x_2, x_3]}{x_4 - x_0} = \frac{-1 - (-1)}{2 - (-2)} = \frac{0}{4} = 0 \\ f[x_1, x_2, x_3, x_4, x_5] &= \frac{f[x_2, x_3, x_4, x_5] - f[x_1, x_2, x_3, x_4]}{x_5 - x_1} = \frac{-1 - (-1)}{3 - (-1)} = \frac{0}{4} = 0 \end{aligned}$$

(b) We will construct the Newton Interpolation formula

$$P(x) = f[x_0] + \sum_{k=1}^n f[x_0, x_1, \dots, x_k](x - x_1)(x - x_2) \dots (x - x_{k-1})$$

using the divided differences calculated in (a).

$$P(x) = 1 + 3(x + 2) + 2(x + 2)(x + 1) - 1(x + 2)(x + 1)x$$

$$P(x) = 1 + 3x + 6 + 2x^2 + 6x + 4 - x^3 - 3x^2 - 2x$$

$$P(x) = -x^3 + (2x^2 - 3x^2) + (3x + 6x - 2x) + (1 + 6 + 4)$$

$$P(x) = -x^3 - x^2 + 7x + 11$$

3. Find the natural cubic spline  $S(x)$  that interpolates:  $(1, 3)$ ,  $(2, 1)$ ,  $(3, 2)$ ,  $(4, 3)$ ,  $(5, 2)$

### Compute $h_j$ (Step Sizes)

The step size between each consecutive  $x$ -value is:

$$h_j = x_{j+1} - x_j$$

Since the points are equally spaced,

$$h_1 = h_2 = h_3 = h_4 = 1.$$

### Compute $\alpha_j$

For each  $j = 1, 2, 3$ , we compute:

$$\alpha_j = \frac{3}{h_j}(a_{j+1} - a_j) - \frac{3}{h_{j-1}}(a_j - a_{j-1})$$

Substituting the function values  $a_j = f(x_j)$ :

$$\alpha_1 = \frac{3}{1}(2 - 1) - \frac{3}{1}(1 - 3) = 3 + 6 = 9.$$

$$\alpha_2 = \frac{3}{1}(3 - 2) - \frac{3}{1}(2 - 1) = 3 - 3 = 0.$$

$$\alpha_3 = \frac{3}{1}(2 - 3) - \frac{3}{1}(3 - 2) = -3 - 3 = -6.$$

**Solve the Tridiagonal System for  $c_j$** 

The system is:

$$\begin{bmatrix} 2 & 1 & 0 & 0 \\ 1 & 4 & 1 & 0 \\ 0 & 1 & 4 & 1 \\ 0 & 0 & 1 & 2 \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \\ c_4 \end{bmatrix} = \begin{bmatrix} 9 \\ 0 \\ -6 \\ 0 \end{bmatrix}.$$

Solving this tridiagonal system (using Gaussian elimination), we get:

$$c_1 = 3, \quad c_2 = 1, \quad c_3 = -1, \quad c_4 = -3.$$

**Compute  $b_j$  and  $d_j$** 

$$b_j = \frac{a_{j+1} - a_j}{h_j} - \frac{h_j}{3}(c_{j+1} + 2c_j).$$

$$d_j = \frac{c_{j+1} - c_j}{3h_j}.$$

Substituting values:

$$b_1 = \frac{1-3}{1} - \frac{1}{3}(1+2(3)) = -2 - \frac{7}{3} = -\frac{13}{3}.$$

$$b_2 = \frac{2-1}{1} - \frac{1}{3}(-1+2(1)) = 1 - \frac{1}{3} = \frac{2}{3}.$$

$$b_3 = \frac{3-2}{1} - \frac{1}{3}(-3+2(-1)) = 1 - \left(-\frac{5}{3}\right) = \frac{8}{3}.$$

$$b_4 = \frac{2-3}{1} - \frac{1}{3}(0+2(-3)) = -1 + 2 = 1.$$

And for  $d_j$ :

$$d_1 = \frac{1-3}{3(1)} = -\frac{2}{3}.$$

$$d_2 = \frac{-1-1}{3(1)} = -\frac{2}{3}.$$

$$d_3 = \frac{-3-(-1)}{3(1)} = -\frac{2}{3}.$$

$$d_4 = \frac{0-(-3)}{3(1)} = \frac{3}{3} = 1.$$

## Final Spline Functions

$$S_1(x) = 3 - \frac{13}{3}(x-1) + 3(x-1)^2 - \frac{2}{3}(x-1)^3, \quad 1 \leq x \leq 2.$$

$$S_2(x) = 1 + \frac{2}{3}(x-2) + 1(x-2)^2 - \frac{2}{3}(x-2)^3, \quad 2 \leq x \leq 3.$$

$$S_3(x) = 2 + \frac{8}{3}(x-3) - 1(x-3)^2 - \frac{2}{3}(x-3)^3, \quad 3 \leq x \leq 4.$$

$$S_4(x) = 3 + 1(x-4) - 3(x-4)^2 + 1(x-4)^3, \quad 4 \leq x \leq 5.$$

4. (a) We are given the following data points:

$$(x_0, y_0) = (0.1, -0.29004996), \quad (x_1, y_1) = (0.2, -0.56079734), \quad (x_2, y_2) = (0.3, -0.81401972).$$

The step sizes are:

$$h_1 = x_1 - x_0 = 0.2 - 0.1 = 0.1, \quad h_2 = x_2 - x_1 = 0.3 - 0.2 = 0.1.$$

Using the cubic spline formulation, we compute the right-hand side:

$$\begin{aligned} d_1 &= \frac{6}{h_1} \left( \frac{y_2 - y_1}{h_2} - \frac{y_1 - y_0}{h_1} \right). \\ &= \frac{6}{0.1} \left( \frac{-0.81401972 + 0.56079734}{0.1} - \frac{-0.56079734 + 0.29004996}{0.1} \right). \\ &= 60 \left( \frac{-0.25322238}{0.1} - \frac{-0.27074738}{0.1} \right). \\ &= 60(-2.5322238 + 2.7074738) = 60(0.17525) = 10.515. \end{aligned}$$

Since this is a natural spline the boundary conditions are:

$$M_0 = 0, \quad M_2 = 0.$$

Thus, solving for  $M_1$ :

$$2(h_1 + h_2)M_1 = d_1.$$

$$2(0.1 + 0.1)M_1 = 10.515.$$

$$0.4M_1 = 10.515.$$

$$M_1 = 26.2875.$$

The cubic spline equation takes the form:

$$S_i(x) = a_i + b_i(x - x_i) + c_i(x - x_i)^2 + d_i(x - x_i)^3.$$

For  $S_1(x)$ , in  $[0.1, 0.2]$

$$a_1 = y_0 = -0.29004996.$$

$$\begin{aligned}
b_1 &= \frac{y_1 - y_0}{h_1} - \frac{h_1}{6}(M_1 + 2M_0). \\
&= \frac{-0.56079734 + 0.29004996}{0.1} - \frac{0.1}{6}(26.2875). \\
&= -2.7074738 - 0.438125 = -3.1456. \\
c_1 &= \frac{M_0}{2} = 0. \\
d_1 &= \frac{M_1 - M_0}{6h_1} = \frac{26.2875 - 0}{6(0.1)} = \frac{26.2875}{0.6} = 4.3813.
\end{aligned}$$

Thus, the first spline equation is:

$$S_1(x) = 4.3813(x - 0.1)^3 - 1.3144(x - 0.1)^2 - 2.6198(x - 0.1) - 1.9303 \times 10^{-2}.$$

For  $S_2(x)$ , in  $(0.2, 0.3]$

$$\begin{aligned}
a_2 &= y_1 = -0.56079734. \\
b_2 &= \frac{y_2 - y_1}{h_2} - \frac{h_2}{6}(M_2 + 2M_1). \\
&= \frac{-0.81401972 + 0.56079734}{0.1} - \frac{0.1}{6}(0 + 2(26.2875)). \\
&= -2.5322238 - 0.87625 = -3.4085. \\
c_2 &= \frac{M_1}{2} = \frac{26.2875}{2} = 13.1438. \\
d_2 &= \frac{M_2 - M_1}{6h_2} = \frac{0 - 26.2875}{6(0.1)} = \frac{-26.2875}{0.6} = -4.3813.
\end{aligned}$$

Thus, the second spline equation is:

$$S_2(x) = -4.3813(x - 0.2)^3 + 3.9431(x - 0.2)^2 - 3.6713(x - 0.2) + 5.0797 \times 10^{-2}.$$

So

$$S(x) = \begin{cases} 4.3813 \cdot x^3 - 1.3144 \cdot x^2 - 2.6198 \cdot x - 1.9303 \times 10^{-2}, & \text{if } x \in [0.1, 0.2], \\ -4.3813 \cdot x^3 + 3.9431 \cdot x^2 - 3.6713 \cdot x + 5.0797 \times 10^{-2}, & \text{if } x \in [0.2, 0.3]. \end{cases}$$

(b) Since we must find  $f(0.18)$  and  $0.18 \in [0.1, 0.2]$ , we use  $S_2(x)$ .

$$S(0.18) = 4.3813(0.18)^3 - 1.3144(0.18)^2 - 2.6198(0.18) - 1.9303 \cdot 10^{-2}$$

$$S(0.18) = -0.507873$$

$$\begin{aligned}
S'(x) &= \frac{d}{dx}(4.3813x^3 - 1.3144x^2 - 2.6198x - 0.019303) \\
&= 13.1439x^2 - 2.6288x - 2.6198
\end{aligned}$$

Substituting  $x = 0.18$ :

$$S'_1(0.18) = 13.1439(0.18)^2 - 2.6288(0.18) - 2.6198 = -2.6671$$

To find the error

$$\begin{aligned}
 f(0.18) &= (0.18)^2 \cos(0.18) - 3(0.18). \\
 &= 0.0324 \cos(0.18) - 0.54. \\
 &= 0.0324 \times 0.983 - 0.54. \\
 &= 0.03186 - 0.54 = -0.50814.
 \end{aligned}$$

This means that the error is

$$\begin{aligned}
 |f(0.18) - S(0.18)| &= |-0.50814 - (-0.507873)|. \\
 &= |-0.000267| = 0.000267.
 \end{aligned}$$

For  $S'(x)$ , we compute

$$\begin{aligned}
 f'(x) &= 2x \cos x - x^2 \sin x - 3. \\
 f'(0.18) &= 2(0.18) \cos(0.18) - (0.18)^2 \sin(0.18) - 3. \\
 &= 0.36 \times 0.983 - 0.0324 \times 0.179 - 3. \\
 &= 0.35388 - 0.0057996 - 3. \\
 &= -2.6519.
 \end{aligned}$$

Therefore the error is

$$\begin{aligned}
 |f'(0.18) - S'(0.18)| &= |-2.6519 - (-2.6671)|. \\
 &= |0.0152|.
 \end{aligned}$$

5. A natural cubic spline has second derivatives equal to 0 at the endpoints. The second derivative of a cubic polynomial is a linear function. Let  $f(x) = ax^3 + bx^2 + cx + d$  be a general cubic polynomial, where  $a \neq 0$ . The first derivative is  $f'(x) = 3ax^2 + 2bx + c$ . The second derivative is  $f''(x) = 6ax + 2b$ . For  $f(x)$  to be its own natural cubic spline,  $f''(x_0) = 0$  and  $f''(x_1) = 0$ . This means  $6ax_0 + 2b = 0$  and  $6ax_1 + 2b = 0$ . Subtracting the two equations, we get  $6a(x_1 - x_0) = 0$ . Since  $x_1 \neq x_0$ , it must be that  $a = 0$ . If  $a = 0$ , then  $2b = 0$ , so  $b = 0$ . This contradicts the assumption that  $f(x)$  is a cubic polynomial ( $a \neq 0$ ). Therefore,  $f(x)$  cannot be its own natural cubic spline unless  $f''(x)$  is identically zero, which means  $f(x)$  is at most a linear function.
6. (a) *Proof.* Note that by the triangle inequality, we have

$$|m_{kk}x_k| = \left| \sum_{j \neq k} m_{kj}x_j \right| \leq \sum_{j \neq k} |m_{kj}||x_j|.$$

By definition,  $k$  was chosen such that  $|x_k| = \max_{1 \leq j \leq n} |x_j|$ . Therefore, since  $|m_{kj}|$  is non-negative for all  $j \neq k$ , we must have

$$|m_{kk}||x_k| = |m_{kk}x_k| \leq \sum_{j \neq k} |m_{kj}||x_j| \leq \sum_{j \neq k} |m_{kj}||x_k| = |x_k| \sum_{j \neq k} |m_{kj}|.$$

Dividing by  $|x_k|$  gives

$$|m_{kk}| \leq \sum_{j \neq k} |m_{kj}|$$

which is the desired result.  $\square$

- (b) We may first assume that  $h_i > 0$  for all  $i$ , since we may simply choose the nodes  $x_i$  in increasing order<sup>1</sup>. Note that the matrix given by

$$A_{ij} = \begin{cases} 2(h_i + h_{i+1}) & \text{if } i = j \\ h_i & \text{if } j = i - 1 \text{ or } j = i + 1 \\ 0 & \text{otherwise} \end{cases}$$

satisfies the following for each  $i$ :

$$|A_{ii}| = |2(h_i + h_{i+1})| = 2(h_i + h_{i+1}) > 2h_i = \sum_{j \neq i} A_{ij}.$$

Therefore,  $A$  is strictly diagonally dominant, and thus invertible.

Furthermore, note that since  $a_j = f(x_j)$ , the constant coefficients,  $a_j$  are uniquely determined<sup>2</sup> by  $f$ . Since  $A$  is invertible, there is a unique solution to the system

$$A\mathbf{x} = \mathbf{b}$$

where

$$\mathbf{x} = \begin{pmatrix} c_1 \\ c_2 \\ \vdots \\ c_{n-1} \end{pmatrix} \quad \text{and} \quad \mathbf{b} = \begin{pmatrix} \frac{3}{h_1}(a_2 - a_1) - \frac{3}{h_0}(a_1 - a_0) \\ \frac{3}{h_2}(a_3 - a_2) - \frac{3}{h_1}(a_2 - a_1) \\ \vdots \\ \frac{3}{h_{n-1}}(a_n - a_{n-1}) - \frac{3}{h_{n-2}}(a_{n-1} - a_{n-2}) \end{pmatrix}.$$

Therefore, since  $a_j$  is uniquely determined by  $f$ , so is<sup>3</sup>  $c_j$ , and by extension

$$b_j := \frac{1}{h_j}(a_{j+1} - a_j) - \frac{h_j}{3}(c_{j+1} + 2c_j)$$

and

$$d_j := \frac{1}{3h_j}(c_{j+1} - c_j)$$

are also uniquely determined by  $f$ . Therefore, the family  $\{S_j\}_{0 \leq j \leq n-1}$  is the unique cubic spline on  $f$ , which is the desired result.

<sup>1</sup>Also note that we assume each node is distinct, therefore,  $h_i \neq 0$  for all  $i$

<sup>2</sup>That is to say, for the family  $\{S_j\}_{0 \leq j \leq n-1}$  to be a cubic spline on  $f$ , the conditions derived in class must be satisfied. Showing that the coefficients which satisfy these conditions are unique, then shows that the cubic spline is unique. This will be assumed from now on.

<sup>3</sup>We also note that  $c_0 = c_n = 0$ , so they are also unique.
